TOPIC TAGS: antenna, slot antenna

ABSTRACT: In the slot-in-the-cylinder omnidirectional antenna, the rear half-space is considerably shielded by the body of the cylinder. This shielding effect can be reduced by introduction of an impedance structure on the cylinder surface, which would obviate the necessity of increasing the number of radiators. Two methods are considered: (1) Increasing the cylinder surface impedance and generating an unidirectional azimuthal wave in order to ensure smoother directional pattern; (2) Exciting two opposite direction azimuthal surface waves within limited areas of the cylinder surface in such a fashion that their interference is avoided. The second method theoretically yields a much better directional pattern. Orig. art. has: 4 figures and 3 formulas. [03]

Successes of Soviet Electrophotography (Uspeshi sovetskoj elektrofotografii) A Scientific and Technical Conference on Questions of Electrophotography (Nauchno-tekhnicheskaya konferentsiya po voprosam elektrofotografii)

PUBLICATION: Zhurnal nauchnoj i prikladnoj fotografii i kinematografii, 1959, Vol. 4, No. 2, pp. 149-52 (USSR)

ABSTRACT: This is an account of a scientific and technical conference on electrophotography, the first to be held in the Soviet Union and evidently in the world. It was organized in Vil'nyus on December 16-19, 1958 by the Soviet Academy of Lithuania's Litovskoye (Council) for National Economy of the Lithuanian SSR, the Council of National Economy of the Lithuanian SSR, the Council of Scientific and Technical Committees of the Lithuanian SSR (State Scientific and Technical Committee), the Council of Ministers of the Lithuanian SSR, and the Lithuanian Scientific Research Institute of Electrophotography.

The Conference attended by over 300 scientific workers was opened by the Deputy Chairman of the Council for National Economy of the Lithuanian SSR, P. A. Kalnietis, after which the Director of the Institute for Electrography, I. I. Zhitovich, reported the state and prospects for development of electrophotography in the USSR. He said: "The research in this field should be carried out along the following lines: a) research for new photo-active materials with high dark resistance; b) physical research into the internal photoeffect; c) development of photoconductive layers; d) development of the theory of the electrophotographic process. I. I. Zhitovich (speaking also for O. G. Popov) gave a report in which he suggested determining the light sensitivity of electrophotographic layers in coiff units. N. Z. Pavlina (speaking also for I. I. Zhitovich, I. I. Zhdanov, V. Varkovich, V. I. Kalinavka and O. N. Sosulin) reported on one research project on the development of a semiconductor electrophotographic layer. V. F. Tschokin gave a report on highly sensitive electrophotographic layers and an electro-optic device. He reviewed the formation process of the latent electrophotographic image on the basis of the zonal theory. He also described the design of an electrostatic separator for determining sensitivity by the relaxation period of a charge on the surface of the layer, and the circuit of an electrophotographic copying device. After finished describing the latter and then spoke on the mechanics and kinetics of the development of the latent electrophotographic image in liquid developer.

card 3/0

207774-2-1978
 Successes of Soviet Electrophotography: A Scientific and Technical Conference on Questions of Electrophotography

F.M. Vinogradov described some of the features of the carbonite and liquid methods of electrophotographic development. Yu.I. Karpanko derived his report on the criterion of light sensitivity of the electrophotographic processes. After the report, a discussion took place on methods of determining the light sensitivity of electrophotographic layers. A.N. Chernyakov spoke on the prospects of developing polymeric processes using electric and magnetic forces. O.V. Grigor'ev (speaking also for I.I. Zhilovich, A.I. Sushchik, V.A. Gorderev, G. I. Faibis and Yu. N. Koval'yev) reported on the development of electrophotographic reproducing equipment. I.I. Paubin (speaking also for I.I. Zhilovich, A.I. Sushchik, A.G. Bochko- vich, N.M. Gol'dividik and N.I. Rautenkau) reported on the use of electrographic methods in recording oscillographs and other recording instruments.

V.P. Jushchenko (speaking also for L.N. Shishkin) spoke on the possibility of electrophotographically recording images from electron-beam tubes. V.S. Karol (speaking also for B.I. Zarevich, T.I. Koslovskaia, S.I. Alimukashova, M.K. Naymova, I.F. Zhilinskaya and A.I. Bontridder) gave a detailed description of laboratory and machine methods of producing photoconductive paper (zinc oxide was used). A.A. Smirnov (speaking also for I.I. Zhilovich, O.V. Grigor'ev, V.A. Gorderev, N.Y. Pridotor and T.S. Gorch) described a laboratory and industrial machine for producing photoconductive paper. T.D. Chirkina (speaking also for V.A. Gerasimov) reported on a method of preparing electrophoto-graphic materials using an AC bridge. G.I. Kozlovich (speaking also for V.I. Serecov) spoke on developing methods of electrophotography and thermogalvanography, including developer's drying, reverse lance bath, lithograph reversal methods of separating the electrostatic potentials of electrophotographic layers, stressing that the oscillating electrode should not be placed above a layer with varying potential as this causes self-discharge. A.V. Krivovas (speaking also for R.J. Serecov, A.G. Grigor'ev and Ye. S. Skuyats) spoke on the technique of producing television papers in an electrostatic field and showed samples produced by the Uralskheskogo paper factory. Ye.L. Reznichenko (speaking also for V.P. Jushchenko) described methods of electrophotographic reproduction of scientific research results. He paid tribute to the work of the Scientific Institute of Electrophotography in Kirovgrad and the Institute of Polygraphy and Photomechanics (Kirovgrad) (Polygraphicheskii Nauchnoe Institutiye (Inzcom)). Works were then held

Card 6/10

on methods of measuring the potential of charged electrophotoelectric layers; the theoretical paper was shown in B.I. Filinov's report. Pick-up and analysis of the oscillations of the electrode probe can be explained if the electrode probe above its surface is fixed and the pick-up is connected to it by a conductor cable. In the debate on Y.L. Kozakov's report it was stated that the research of academics A.M. Tsvetin and V.K. Patrushev should be considered as the basis of all work done. A stereophotographic paper with two as they were the first to show the possibility of optical sensitization of the lateral photocell in GDO. N.N. Gol'didev then gave a report on the deposition of class 6 corona discharge. A.I. Kainikas and A.P. Tsvetin reviewed some of the features of the use of electronographic methods in radiography. M.I. Syutko speaking also for L.I. Zhuravich, I.A. Plavina, Yu. M. Vlasov and V. S. Vlasov reported on relaxation processes in semiconductor layers using a vibration photodetector. N.K. Ishakova gave a report on research on electrophysical properties of the polycrystalline layers of an aluminum cadmium. L.P. Nikolskaya spoke on some of the photoelectric properties of Cd₂Sn₃ and Sn₃Ge₂; the absorption maximum of the latter is about 900 m⁻¹. S.M. Dzepan reported on methods of obtaining selenium light-sensitive layers, including sublimation and thermal treatment. It was also found that the sensitivity of the layers increased after storage for 1.5 to 2 months at room temperature. F.M. Podolskikh (speaking for S.G. Granitskii) spoke on the search into the electrical properties of electrophotographic layers of amorphous cadmium and powder zinc oxide. N.K. Shchukin (speaking also for V.V. Pavlyuk) discussed the production of selenium layers and some of their properties. Finally the following reports on ferroelectrography were delivered: 1) Ya. A. Kurnachev, "Ferroelectric Characteristic of Barium-Titanium-Iloya with Various La₂O₃ Concentrations"; 2) V. I. Vinogradov, "Electrodeposited Ferroelectric Layers of Magnetic Oxides"; 3) V. S. Petrenko, "Ferroelectric Properties of Ferroelectric Layers"; 4) Ye. Buzek, I.V. Pavlyuk, "Ferroelectric Properties of Ferroelectric Layers"; 5) Ye. Buzek, I.V. Pavlyuk, "Ferroelectric Properties of Ferroelectric Layers". There was also an exhibition stand of the Ferroelectrographic Institute. The most important conclusion of the conference was that a similar approach had been made so the possibility of wide technical use of the methods of electrography.

It was considered that although work in this field is relatively narrow only in 1959-60 it has survived as a branch of the USSR for 10 years. While admitting that it was easier to reproduce results already achieved than to be the first to arrive at them, the conference observed that the Americans took good care that no important information appeared in the literature available.

TITLE: Sessiiyess of Soviet Electrophotography (Ussrshi, sretse-
koy elektrofotografiy). A Scientific and Technical Con-
ference on Questions of Electrography (Nauchnoe
cheeskaya konferentsiya po voprosam elektrofotografii).

PERIODICAL: Zhurnal nauchnyi prikladnoy fotografiy i kinematografii.
1959, Vol. 4, Nr. 2, pp. 149-152 (USSR).

ABSTRACT: This is an account of a scientific and technical conference on electrography, the first to be held in the Soviet Union and evidently in the world. It was organized in Vil'nius on December 16-19, 1956 by the Soviet Academy Khodya-Nyva Litovskogo SFR (Council for National Economy of the Lithuanian SSR), the Governmental Research Institute of the Lithuanian SSR, the Soviet Academy LSSR (State Scientific and Technical Committee of the Council of Ministers of the Lithuanian SSR) and the Kaunas-Isidorovskiy Institute elektrofotografii (Scientific Research Institute of Electrography). The conference, attended by over 300 scientific workers, was opened by the Deputy Chairman of the Council for National Economy of the Lithuanian SSR P.M. Kulikov, after which the Director of the Institute for Electrography I.I. Zilberich, reviewed the state and prospects for development of electrography in the USSR. He stated that research in this field should be carried out along the following lines: 1) a search for new photo-active materials with high dark resistance; 2) detailed research into the internal photoeffect; 3) development of photoactive materials based on the theory of the electron-hole recombination process. I.G. Sosulin (speaking also for O.G. Fesov) gave a report on the sensitivity of electrophoto-graphic layers in GOMZ. A.E. Kuznetsov (speaking also for I.I. Zilberich, L.I. Leshchuk, N.N. Markovich, P.I. Kulikov and Q.N. Sosulin) reported on some research on the sensitization of a semiconductor in electrophoto-graphic layers. I.I. Zilberich gave a report on highly sensitive elektrofotografiye layers and an elektrofotografiye device, and reviewed the formation process of the latent electrophoto-graphic image on the basis of the tonal theory. He also described the design of an electrophotodetector for determining the sensitivity to the relative charge on the surface of the layer, and the circuit of an elektrofotografiye device. Analysis of the obtained descriptive data of the layer and then arose on the scientific and technical aspects of the development of the latent electrophoto-graphic image in liquid developer.

507774-2-15/28
 Successes of Soviet Electrophotography: A Scientific and Technical Conference on Questions of Electrophotography

K.N. Vinogradov described some of the features of the cascade and liquid methods of electrophotographic development. Yu.E. Karpechko derived his report to the conference on the sensitivity of the electrophotographic process. After the report, a discussion took place on methods of determining the light sensitivity of electrophotographic layers. In particular,发言者 spoke on the prospects of developing photoreceptor processes using electric and magnetic forces. O.V. Jiravov (speaking also for I.I. Zhilevich) reported on the use of electron beam recording, A.A. Gordiyeva, P. S. Pashcheva and Yu. V. Kozai (speaking also for N. N. Pavlenko) reported on the development of electrophotographic reproduction equipment. A.G. Sotnikov, T.N. Gal'yavikil and N.I. Rastnitskaya (speaking also for L.N. Zhilavich, A.S. Sotnikov and N. N. Pavlenko) reported on the use of electrophotographic methods in recording oscillographs and other recording instruments.

Y.F. Lushpanko (speaking also for L.N. Zhilavich) spoke on the possibility of electrophotographically recording images from electron-beam tube. I.M. Kirov (speaking also for N. N. Pavlenko) spoke on the use of electron-beam tubes in electrophotography. V.P. Salimjanov, Z. M. Kervantsev, V. V. Chirkov, V. V. Kostylev, V. N. Kostylev and E.I. Novitskaya (speaking also for V. V. Chirkov) gave a detailed description of carbon-tetrachloride method of producing photoelectric conductor paper (fine oxide was used). A.A. Gordiyev (speaking also for I.I. Zhilevich, O.V. Jiravov, V. V. Gordiyev, N.Y. Pashcheva and F.W. Gell) described a laboratory and industrial section for producing photoelectric conductor papers. T.N. Zhilavina (speaking also for Y.M. Gashin) reported on a section of standard electrophotographic materials using an a/c bridge. G. I. Motzhanovich (speaking also for A.I. Glikens and I.D. Kostylev) spoke on developing methods for electrophotography and farmakologicheskaya (speaking also for V. V. Gordiyev) spoke on the development of new drugs.

After the conference, the following recommendations were made:

1. The cascade method of electrophotographic development should not be placed above a vertical electrostatic field.

2. The cascade method of electrophotographic development should be used in the production of photoelectric paper.

3. The cascade method of electrophotographic development should be used in the production of photoelectric paper produced by the Irkutsk paper factory.

4. I.M. Kostylev gave a historical review of the development of electrophotographic methods in which he paid tribute to the work of the Scientific Research Institute of Electricity in Vil'nyus and the Institut Poligraficheskogo Mashinostroyeniya (Institute of Polygraphic Machine-building Institute (Kondor)).

Card 6/10

on methods of measuring the potential of charged electro-photographic layers. The vibration pick-up method used here above is B.I. Tikhonov's report to be not always accurate. S.G. Kostylev, while stating that the influence of the oscillating electrode can be eliminated if the electrode probe above its surface is fixed and the pick-up is connected to it by a shielded cable. In the debate on T.L. Neelov's report it was stated that the research of Academicians A.N. Terenin and Ye.R. Paterye should be considered as the basis of all work on electrophotographic papers with 200 nm as they were the first to show the possibility of optical sensitization of the internal photoeffect in lead. N.M. Golovidz then gave a report on the deposition of charges by a corona discharge. A.L. Kondratenko and I.P. Tsvetkov reported on the results of the use of

electrographic methods in radiography. L.V. Byun Ko (speaking also for I.I. Chilovich, I.I. Pavlin, Yu.K. Vishchikov and Yu.A. Zhitova) reported on polarization processes in semiconductor layers, using a vibration electrometer. Yu.P. Vlasakov gave a report on research on some physical properties of the polycrystalline layers of selenium cadmium. N.P. Makhlyavichyus spoke on some characteristics of the photoelectric properties of Sb_2Se_3 and Sb_2Se_3 ; the absorption maximum of the latter is about 900 nm.

A.M. Slobodennikov reported on the choice of obtaining selenite layers, including sublimation and thermal treatment. It was also found that the sensitivity of the layer increased after storage for 1.5 to 2 weeks at room temperature. N.I. Polozkina (speaking also for G.O. Grishnikov) spoke on research into the electrical properties of electrophotographic layers of amorphous selenium and powdered zinc oxide. N.I. Shilovoy (speaking also for A.J. Tsvetkov) discussed the production of selenium layers and some of their properties. Finally the following reports on ferromagnetography were delivered: 1) Ya. Kamachkov, V.H. Zhdanov, "Electrodeposition of Magnetic Layers with Some Electrical Characteristics"; 2) V. P. Tsvetkov, "Electrodeposition of Magnetic Oxide Coatings by Electrographic Methods"; 3) V. P. Tsvetkov, "Electrodeposition of Ferromagnetic Layers through Plastic Resins"; 4) T. G. Leshchenko, "Electrochemical Rock Experiments in Ferromagnetic Materials"; 5) There was also an exhibition showing the work of the Electrotechnical Institute. The most important conclusion of the conference was that a solid approach had been made to the possibility of wide technical use of the methods of electrophotography. It was considered that although work in this field actually started only in 1979-80 it was carried as much ground as the USA in 10 years. While admitting that it was easier to reproduce results already achieved than to be the first to arrive at them, the conference observed that the Americans took good care that no important information appeared in the literature available.

TITLE: Electric Heating of Valve Stock Replaces Heating in Flame Furnaces (Elektronagrev zagotovok klapanov vzamen nagreva v plamennykh pechakh)

PERIODICAL: Tekhnol. transp. mashinostroyeniya, 1957, Nr 8, pp 19-23

ABSTRACT: A description of a process in which valve stock, made of Kh9S2 steel, is heated by inductive methods in a standard KIN-20 forge heater. The flame-heated forgings have a medium-acicular martensite structure with an R_c of 52-55, whereas induction-heated forgings have a fine-acicular martensite structure with an R_c of 56-58. The introduction of the induction-heating method produced a 25 percent increase in the production, increased the durability of the dies by 17 percent, effected a 5 percent saving of metal, and reduced the total cost of heating the stock by 31 percent. Experiments were carried out in which the heating of stock for tempering purposes was combined with heating operations intended to prepare the metal for die forging. The mechanical properties of metal treated in this fashion are comparable to

Card 1/2

137-1958-3-5049

Electric Heating of Valve Stock Replaces Heating in Flame Furnaces

those of metal treated in the standard manner, whereas the strength characteristics are even somewhat higher. Sorbitic structure is observed in both cases. In the future separate heating operations for tempering may be eliminated.

TITLE: Vibration grinding and polishing of parts

SOURCE: Vestnik mashinostroyeniya, no. 9, 1965, 64-68

TOPIC TAGS: metalworking; vibration, vibration effect, metal polishing, metal finishing, copper sulfate, nonmechanical metal removal, GRINDING, ABRASIVE

ABSTRACT: Some aspects of vibration grinding and polishing are discussed. The polishing action is the result of the relative velocities of the particles and the parts. In the past, the motion of the vibrating reservoir has been made elliptical. The most effective abrasive action takes place over only about 0.1 of the period, giving a vibrational efficiency of $\approx 15\%$ for this type of a device. By making the trajectory of the reservoir a circle, the efficiency can be increased to 70-75%. The abrasive force for such a case is derived as

(where m = mass of polished part; A and ω = amplitude and frequency of reservoir

Card 1/3

UDC: 621.924.61.7

L 11972-66

ACC NR: AP5028986

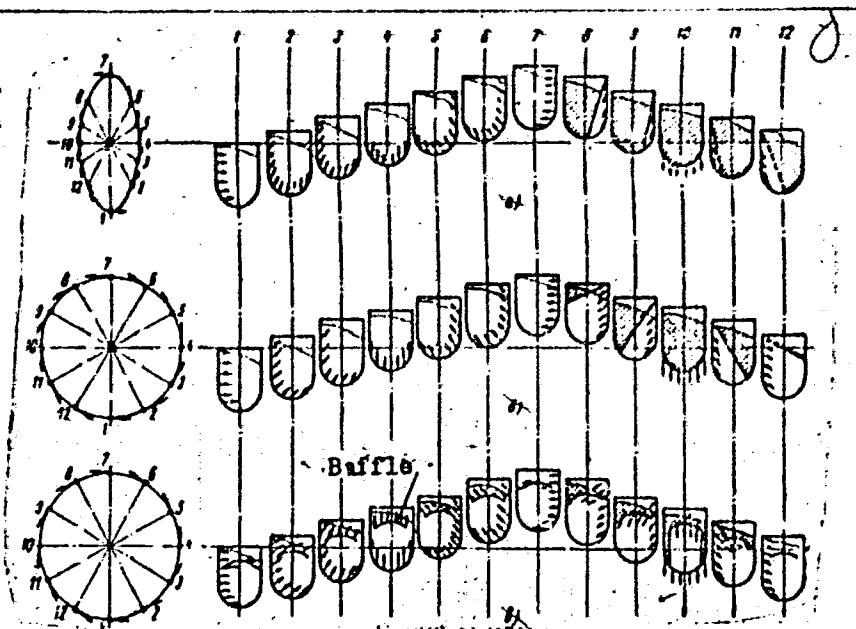

vibration; ε = characteristic constant for the damping and frictional properties of the load, including parts, abrasive particles, and chemicals). Presently, frequencies of up to 3000 cpm and amplitudes of 6-7 mm can be used. Figure 1 shows the actions of the reservoir walls on the charge for elliptical and circular motions, with a baffle installed in the reservoir. Preliminary tests with baffles show that the efficiency can be increased to 90-95% and capacity by factors of 2-3. The recommended abrasive particle size is shown to be $\lambda = L_{\text{min}}/5$ (where L_{min} = minimum dimension of part to be polished). A new modification of the process uses a compound in the charge, which reacts chemically with the metal of the part and speeds up the polishing. For example, using CuS_4 in the charge to machine steel, the time required to remove 15 mg/cm^2 can be reduced from 1 hour (without CuS_4) to 5-10 minutes. Although the cost of this chemi-mechanical process increases by a factor of 2-3, the capacity is increased by a factor of 10. A finish of class 10-12 can be obtained by the above methods.

ABSTRACT: The introduction of an HF induction heating (H) installation at the plant made it possible to: a) Obtain a homogeneous structure of the blanks; b) perform H without scaling, which increased the durability of the dies and resulted in a monthly economy of ~1700 kg of metal; c) increase the hardness of the valve after stamping in conjunction with HF-induction H, thus eliminating an additional operation of heating prior to quenching.

TITLE: The term splitting in multicomponent disordered crystals

PERIODICAL: Fizika tverdogo tela, v. 4, no. 12, 1962, 3522-3525

TEXT: The theory of term splitting in crystals, developed by Bethe (Ann. de Phys., 3, 133, 1929) is extended to multicomponent disordered crystals. It is assumed that a multicomponent crystal comprises N sites. In the case of n types of atoms, N_t ($t = 1, 2, \dots, n$), $\sum_t N_t = N$ holds. Each site is

characterized by a set M of four symbols ($ik\alpha$). i characterizes the color (the type of atom) of the point, k the number of atoms of a given type, l the spatial distribution of the other points with respect to the one considered and α gives the condition that among sites of equal color there may be such as have different magnetic moments. $l(R)$ characterizes an island in space which is bounded by a sphere of radius R . M is the set of all sites, whilst the set $M_{ij}(i,k,l)$ of all sites of the same type is a

Card 1/2

S/181/62/004/012/023/052
B104/B102

The term splitting in multicomponent ...

subset of M. A sequence $R_{\min}^{(j)} < R_1^{(j)} < R_{\max}^{(j)}$ is obtained if one point is connected by rays with the remaining sites and if the distances apart of two sites are ordered. $l(R_{i1}) \leq l(R_{i2})$ holds for the symmetries $l(R_{ik})$ of the island if $R_{i1} < R_{i2}$. If the symmetry $l(R_{\max})$ is known, it becomes possible to find a limiting radius $(R_i)_{\text{limit}}$, for which $l(R_i) = l(R_{\max})$. Thus the problem is reduced to finding the symmetry of the islands, starting from $l(R_{\min})$. The problem is solved for spinel and garnet structures. It is shown that for spinel-type structures that have tetrahedral lattice sites the character of the term splitting is completely explained if due consideration is given to the immediate neighborhood, whereas in the case of octahedral lattice sites two coordination spheres must be considered. There are 1 figure and 2 tables.

Title : Linear functional problems

Periodical : Dok. AN SSSR 102/1, 21-23, May 1, 1955

Abstract : A series of theorems is presented giving the conditions under which differential equations of the following type have solutions and their number:

$$\frac{dr(x)}{dx} = A(x) r(x) + b(x),$$

satisfying the so-called functional condition

$$Q_0 r(a) + \int_a^b dG(x) r(x) = Q,$$

where the Q and $G(x)$ are quadratic matrices of the n -order. Three references: 1 Fr. and 2 USSR (1932-1950).

AUTHOR: Ginderg, A. M.; Nayshuller, M.A.

TITLE: Effect of the ultrasonic field on parkerizing and properties of phosphate coatings

SOURCE: Zhurnal prikladnoy khimii, v. 57, no. 3, 1964, 553-557

TOPIC TAGS: Ultrasound, parkerizing, phosphate coating, corrosion property, porosity, electrical stability, ultrasonic field

ABSTRACT: The possibility of intensifying the parkerizing process of ferrous metals and improving the physico-mechanical and corrosion properties of phosphate films with the aid of ultrasonics was studies. The possibility of substituting the sandblast treatment of the surface of products, which was usually employed before parkerizing and provided the best results, is studied with ultrasound parkerizing. The superimposition of the ultrasonic field during parkerization makes it possible to precipitate qualitative phosphate films in steel without sandblast treatment. The phosphate films obtained in the ultrasound field with 16-22 kc frequency for 40-60 minutes are less porous and differ by more highly

PURPOSE: This book is intended for coal and ore mining engineers.

CONTENTS: The collection of articles reports on the results of scientific studies conducted by members of the Institute of Mining Technology of the USSR on problems of developing and exploiting mineral and ore deposits. The book is divided into two parts. Part I discusses the development and exploitation of coal deposits, the second is devoted to the development and exploitation of metal deposits. The scientific methods used are described and various exploitation methods, including those applied in selecting exploitation of different mineral resources, the determination of economic use of basic elements in the use of modern mining equipment, the preparation and exploitation of coal, the problems in the development and exploitation of ore deposits, the drainage and mining methods of underground exploitation of deposits in the area of the Kursk Magnetic Anomaly, the open pit mining method used in exploiting the rich KMA area, the determination of class of ore, further ore dressing. The book is dedicated to Andrianov, L. D. and Ulyanova Shchegolev, related engineer. The articles are accompanied by diagrams, tables, and bibliographic references.

Author: M.I. S.A. Mal'zevsky, Corresponding Member USSR Academy of
Sciences, Dr. of Technical Sciences, Ph.D. Technics, Head of
P.G. Geological and Mining Problems Institute.

NOTES: This book is intended for coal and ore mining engineers.

CONTENTS: The collection of articles reports on the results of extensive studies conducted by members of the Institute of Mining Developments at the All Union on problems of developing and exploiting coal and ore deposits. The book is divided into two parts. Part I discusses the development and exploitation of coal deposits. The second part discusses the development and exploitation of mineral resources. Methods of determining mineral reserves and principles of selecting operating conditions. The determination of reserves of various natural resources is discussed. Methods of calculating the costs of mining operations and application of underground development, and data preparation in the development and exploitation of coal deposits. In the development and exploitation of iron deposits, the calculation and distribution methods used in underground exploitation of deposits in the area of the Kursk Magnetic Anomaly, the open pit mining method used in exploiting the iron ore area, the determination of sizes of ore and further ore dressing. The book is dedicated to Academician Alexei Nikolaevich Shchegolev, mineral engineer. The articles are accompanied by diagrams, tables and bibliographic references.

TITLE: New Technology of Excavation for the Mining of Vein Deposits

PERIODICAL: Gornyy zhurnal, 1960, No. 5, pp. 14 - 18

TEXT: Since 1951 the tin mines of the Khrustal'ninskiy kombinat Primorsko-go sovnarkhoza (Khrustal'nyy Combine of the Primorskiy sovnarkhoz) jointly with the Institut gornogo dela AN SSSR (Mining Institute AS USSR) have been engaged in improving the processes applied for the mining of vein deposits. The following mining systems were elaborated in the course of these activities: mining with ore storing in layers; mining with complete storing and stull timbering; mining with divided mining of the ore and with storing of the debris; downcast excavation with gob flushing and with filling of the mined space. Drilling and blasting operations were also improved. Compared with 1951, the efficiency of a team was trebled at the beginning of

1959. Moreover, experiments were made, using bore holes of smaller diameter (34 to 36 mm) for mining in a narrow working space. 1957 to 1958 new variants of ore drawing from the blocks were elaborated: drawing over ore chutes to the drift ground and subsequent transportation to the lower horizon by means of scrapers; drawing by means of closely spaced drawing chutes. Both variants proved to be suitable. At the same time, attempts were made to organize the work in such a way that one brigade should carry out the biggest number of mining processes, and a maximum interchangeability of laborers should be achieved. After drawing up the plan and fixing the processes, experimental work was conducted in April 1959 in the Khrustal'nyy mine on some blocks of the Volkovskaya vein. The comprehensive brigade under direction of Brigade Leader M. N. Boyko mined 40-m high and 60-m long blocks according to the ore-storing process with continuous drift line along the entire block (Fig. 1). The holes were drilled in the Krivoy Rog with the new telescopic overspeed perforator PT-29 (PT-29) from the zavod "Kommunist" ("Kommunist" Plant). The rate of drilling was 48 to 49 cm/min. The holes were simultaneously drilled to a depth of 1.8 m with 4 to 5 perforators. The holes were arranged in three rows like a chess-

board pattern with a distance of from 0.5 to 0.6 m between rows. The distance between the holes was 0.6 to 0.7 m, as usual. The output increased to 10 to 13 m³ per shift. The rate of drilling increased from 22 to 49.2 cm/min after using core bits of 36 mm diameter (instead of 44 mm). The drift was thus driven at a rate of about 40 m per month, which is unprecedented for the mining of vein deposits in the USSR. In conjunction with the reduced diameter, the use of the new cruciform core bits with interrupted cutting edge from the experimental batch produced by the Kiyevskiy eksperimental'nyy zavod tverdosplavnogo i almaznogo instrumenta (Kiyev Experimental Plant for Hard Alloy and Diamond Tools) was of great influence on the reduction of the bulk of work. The holes in the experimental blocks were blasted with the new explosive Detonit. The mined ore was drawn by means of drawing chutes arranged along the entire block length without interspaces (Fig. 1). The new process was completely adopted by the Tsentral'nyy Mine in December 1959, as well as by the Primorskiy Mine of the kombinat Sikhali (Sikhali Combine) and the Verkhne-Kentsukhinskiy Mine of the kombinat Dal'olovo (Dal'olovo Combine). There are 3 figures, 1 table, and 1 Soviet reference.

TITLE: Accelerations in the tail of the comet 1956 h (Arend-Roland)

PERIODICAL: Referativnyy zhurnal. Astronomiya i Geodeziya, no. 11, 1961, 73,
abstract 11A533 ("Visnyk Kyiv's'k. un-tu", 1958, no. 1, ser..astron.,
matem. ta mekhan., no. 2, 153-157, Ukrainian, Russian summary)

TEXT: Accelerations were determined in the tail of the comet 1956 h from
the motion of cloudy formations and non-homogeneities in it. Accelerations of
particles in the comet tail were determined by A. Ya. Orlov's method on 27 and
30 April and 2 May. The results obtained show that repulsive forces of the order
of 1,000 units of solar attraction acted upon the particles in the comet tail.
Speeds of the particles in the tail increased with increasing radius-vector. Ac-
celerations of the repulsive force at first increased and then decreased with in-
creasing radius-vector of the particle. A further investigation of this problem
has shown that high accelerations of the particles in the comet tail may be caused
by the effect of a corpuscular stream at the base of which was a prominence. ✓

Identification of the prominence with the position of the comet was carried out by projecting the comet on the Sun's disk. There are 6 references.
